This sequence represents the recombinant expression plasmid FBdelPASAF.

This sequence is a packaging-deficient construct having a viral env gene

(in this case from the moloney murine leukaemia a virus) and a selectable

(marker (SM). It is an example of a recombinant expression vector (REV) of

the invention, used to create a packaging cell line. The REVs of the

invention comprise a gene of interest (GOI) and a SM gene. The SM gene is

invention comprise a gene of interest (GOI) and a SM gene. The SM gene is

creamsformed with two REVs of the SM gene to ensure that the SM protein is

from a start codon of the SM gene to ensure that the SM protein is

creamsformed with two REVs, both are replication deficient, one contains

the viral gag-pol gene, the other the viral env gene. By using helper

the viral gag-pol gene, the other the viral env gene. By using helper

constructs, such as the REV's, which are directly selectable and which

provide for high expression of the packaging cell lines are useful for gene

creators may be obtained. The packaging cell lines are useful for gene

therapy. Prior packaging cell lines using full length retroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Packaging-deficient construct; viral gag-pol gene; packaging cell line; moloney murine leukaemia virus; MOMLV; viral env gene; helper construct;

This sequence is a packaging-deficient construct having a viral env gene (in this case from the meloney murine leukaemia virus) and a selectable marker (SM). It is an example of a recombinant expression vector (REV) of the invention, used to create a packaging cell line. The REVs of the invention comprise a gene of interest (GOI) and a SM gene. The SM gene is arranged downstream of the GOI and a GOI associated stop codon is spaced from a start codon of the SM gene to ensure that the SM protein is expressed as a result of translation reinitiation. The cell lines are transformed with two REVs, both are replication deficient, one contains the viral agapol gene, the other the viral env gene. By using helper constructs, such as the REV's, which are directly selectable and which provide for high expression of the viral gene, high titre retroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             systems provide limited titres of infectious retroviral vectors. Co-transfection with a plasmid encoding a SM does not directly select the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     genomes

The packaging cell lines are useful for gene therapy. Prior packaging cell lines using full length retroviral genomes as helper genomes were isolated by cotransfecting them with plasmids encoding selectable markers. However, the helper functions can be lost during the passages of the cells in culture and the current packaging
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3948 ttatcatgtctggatccagatctgggcccatgcggccgcggatcgatnnnnacatgtgag 4007

continuous case from GALV) and a selectable marker (SM). It is an example of a recombinant expression vector (REV) of the invention, used to create a packaging cell line. The REVs of the invention comprises a gene of interest (GOI) and a SM gene. The SM gene is arranged downstream of the interest (GOI) and a SM gene. The SM gene is arranged downstream of the coll and a GOI associated stop codon is spaced from a start codon of the CMS gene to ensure that the SM protein is expressed as a result of the coll contains a result of the coll contains the viral gag-pol gene, the bett are replication deficient, one contains the viral gag-pol gene, the bett are directly selectable and which provide for high expression of which are directly selectable and which provide for high expression of the viral gene, high titre retroviral vectors may be obtained. The packaging cell lines are useful for gene therapy. Prior packaging cell packaging cell lines are useful for gene therapy. Prior packaging cell collectable surfaces as helper genomes were consistent the helper functions can be lost during the passages of markers. However, the helper functions can be lost during the passages of the cells in culture and the current packaging systems provide limited the colls in infectious retroviral vectors. Co-transfection with a plasmid encoding a SM does not directly select the best gag-pol-env-expressing cells. The new retroviral packaging cell lines overcome these problems.
                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GCTGTGTGCACGAACCCCCGTTCAGCCCGACCGCTGCGCCTTATCCGGTAACTATCGTC 1014

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5652138

GENERAL INFORMATION:
APPLICANT: Burton, Dennis R
APPLICANT: Barbas, Carlos F
APPLICANT: Lerner, Richard A
TITLE OF INVENTION: TO HUMAN NEUTRALIZING MONOCLONAL ANTIBODIES
TITLE OF INVENTION: TO HUMAN IMMUNOBERICIENCY VIRUS
NUMBER OF SEQUENCES: 170
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADDRESSEE: The Scripps Research Institute, Office of ADDRESSEE: The Scripps Research Institute, Office of ADDRESSEE: The Scripps Research Institute, Office of STREET: 10666 No. 5652138th Torrey Pines Road, Suite 220, STREET: Mail Drop TPC8

Patent No. 5804440
GENERAL INFORMATION:
APPLICANT: Burton, Dennis R
APPLICANT: Lerner, Richard A
TITLE OF INVENTION: TO HUMAN NEUTRALIZING MONOCLONAL ANTIBODIES
TITLE OF INVENTION: TO HUMAN IMMUNODEFICIENCY VIRUS
NUMBER OF SEQUENCES: 170
CORRESPONDENCE ADDRESS:
